# **Diffraction from Crystals**

## **“Structure Factor”**

### **Lecture 5**

# Coherent elastic scattering

**Incident plane wave:**  $\Psi_{\text{incident}} = \exp[2\pi i(\mathbf{k}_i \cdot \mathbf{r}' - \omega t)] = \exp[2\pi i(\mathbf{k}_i \cdot \mathbf{r}')]$

**Scattered wave:**

$$\Psi_{\text{scattered}} = f(\mathbf{k}_i, \mathbf{k}_d) \frac{\exp[2\pi i \mathbf{k}_d \cdot (\mathbf{r} - \mathbf{r}')] }{|\mathbf{r} - \mathbf{r}'|} = f(\theta) \frac{\exp[2\pi i \mathbf{k}_d \cdot (\mathbf{r} - \mathbf{r}')] }{|\mathbf{r} - \mathbf{r}'|}$$

# Scattering from a lattice

$$V_{\text{atom}}(\vec{r}') = \sum V_{\text{at}}(\vec{r}' - \vec{R}_j)$$

$$\Psi_{\text{scattered}}(\vec{K}, \vec{r}) =$$

$$\frac{-m}{2\pi\hbar^2} \frac{\exp[2\pi i(\vec{k}_d \cdot \vec{r})]}{|\vec{r}|} \int \sum V_{\text{at}}(\vec{r}' - \vec{R}_j) \exp[-2\pi i(\vec{K} \cdot \vec{r}')] d^3\vec{r}'$$

# Scattering from a lattice

$$\vec{r} \equiv \vec{r}' - \vec{R}_j \quad (\text{i.e. } \vec{r}' = \vec{r} + \vec{R}_j)$$

$$f_{\text{el}}(\vec{R}_j, \vec{K}) \approx f_{\text{el}}(\vec{R}_j)$$

Ignore the  $1/r^2$  term to give:

$$\Psi_{\text{scatt}}(\vec{K}) = \frac{-m}{2\pi\hbar^2} \int \sum_{\text{at}, \vec{R}_j} \mathbf{V}_{\text{at}, \vec{R}_j}(\mathbf{r}) \exp[-2\pi i(\vec{K} \cdot (\vec{r} + \vec{R}_j))] d^3\vec{r}'$$

$$= \sum_{\vec{R}_j} \left( \frac{-m}{2\pi\hbar^2} \int \mathbf{V}_{\text{at}, \vec{R}_j}(\mathbf{r}) \exp[-2\pi i(\vec{K} \cdot \vec{r})] d^3\vec{r}' \right) \exp[-2\pi i(\vec{K} \cdot \vec{R}_j)]$$

# Scattering from a lattice

So scattered wave from an array of N atoms:

$$\Psi_{\text{scatt}}(\vec{K}) = \sum_j^N f_{\text{el}}(\vec{R}_j) \exp[-2\pi i(\vec{K} \cdot \vec{R}_j)]$$

## Notes:

- Now have  $\Psi(\vec{K})$  only,  $\vec{R}_j$  are fixed. Means scattered wave depends on incident wave vector.
- This is a Fourier Transform (FT)

Diffracted intensity is proportional to the Fourier Transform of the scattering factor distribution in the material

# Scattering from a lattice

**In simplest form, a crystal is:**

Crystal = lattice + basis + defect displacements

$$\vec{R}_j = \vec{r}_{\text{lattice}} + \vec{r}_{\text{basis}} + \vec{r}_{\text{defects}} = \vec{r}_l + \vec{r}_b + \vec{r}_d$$

**For now, consider a defect free crystal:**

Crystal = lattice + basis

$$\vec{R}_j = \vec{r}_{\text{lattice}} + \vec{r}_{\text{basis}} = \vec{r}_l + \vec{r}_b$$

**Scattered wave:**

$$\Psi_{\text{scatt}}(\vec{K}) = \sum_{r_l} \sum_{r_b} f_{\text{el}}(\vec{r}_l + \vec{r}_b) \exp[-2\pi i(\vec{K} \cdot (\vec{r}_l + \vec{r}_b))]$$

**Basis must be same for all unit cells:  $f(\vec{r}_l + \vec{r}_b) = f(\vec{r}_b)$**

$$\Psi_{\text{scatt}}(\vec{K}) = \sum_{r_l} \exp[-2\pi i(\vec{K} \cdot \vec{r}_l)] \sum_{r_b} f_{\text{el}}(\vec{r}_b) \exp[-2\pi i(\vec{K} \cdot \vec{r}_b)]$$

# Scattering from a lattice

**Repeating:**

$$\Psi_{\text{scatt}}(\vec{\mathbf{K}}) = \sum_{\vec{r}_1} \exp[-2\pi i(\vec{\mathbf{K}} \cdot \vec{r}_1)] \sum_{\vec{r}_b} f_{\text{el}}(\vec{r}_b) \exp[-2\pi i(\vec{\mathbf{K}} \cdot \vec{r}_b)]$$

$$\Psi_{\text{scatt}}(\vec{\mathbf{K}}) = \mathbf{S}(\vec{\mathbf{K}}) \mathbf{F}(\vec{\mathbf{K}})$$

**where:**

$$\mathbf{S}(\vec{\mathbf{K}}) = \sum_{\vec{r}_1}^{\text{lattice}} \exp[-2\pi i(\vec{\mathbf{K}} \cdot \vec{r}_1)] \quad \text{“Shape Factor”}$$

$$\mathbf{F}(\vec{\mathbf{K}}) = \sum_{\vec{r}_b}^{\text{basis}} f_{\text{el}}(\vec{r}_b) \exp[-2\pi i(\vec{\mathbf{K}} \cdot \vec{r}_b)] \quad \text{“Structure Factor”}$$

**$\mathbf{F}(\vec{\mathbf{K}})$  same for all lattice points:**

$$\Psi(\vec{\mathbf{K}}) = \sum_{\vec{r}_1}^{\text{lattice}} \mathbf{F}(\vec{\mathbf{K}}) \exp[-2\pi i(\vec{\mathbf{K}} \cdot \vec{r}_1)]$$

# Structure Factor

## Structure Factor:

- Scattering from all atoms in the unit cell

$$F(\vec{K}) = \sum_{\vec{r}_b}^{\text{basis}} f_{\text{el}}(\vec{r}_b) \exp[-2\pi i(\vec{K} \cdot \vec{r}_b)]$$

**In essence, Structure Factor determines whether or not constructive interference occurs at a given reciprocal lattice point**

**This means our prior condition -  $\vec{K} = \vec{g}$  - is a necessary condition, but is not sufficient**

- There may not be intensity at a given  $\vec{g}$ !

# Structure factor calculation

Consider  $i$  atoms in the unit cell

$$F(\vec{K}) = \sum_i f_i \exp[-2\pi i(\vec{K} \cdot \vec{r}_i)]$$

Location of  $i^{\text{th}}$  atom (with respect to real lattice):

$$\vec{r}_i = x_i \vec{a} + y_i \vec{b} + z_i \vec{c}$$

Diffraction condition ( $\vec{K} = \vec{g}$ ):

$$\vec{K} = h\vec{a}^* + k\vec{b}^* + l\vec{c}^*$$

Using def<sup>n</sup> of  $a^*$ ,  
 $b^*$  &  $c^*$

General from:

$$F(\vec{K}) = \sum_i f_i \exp[-2\pi i(hx_i + ky_i + lz_i)]$$

# Structure Factor

## simple cubic

---

$$F = \sum_i f_i \exp[-2\pi i(hx_i + ky_i + lz_i)]$$

One atom basis :  $r = (0, 0, 0)$

$$\begin{aligned} F &= f \left\{ \exp[-2\pi i(0 \cdot h + 0 \cdot k + 0 \cdot l)] \right\} \\ &= f \left\{ \exp[-2\pi i(0)] \right\} \\ &= f \left\{ \exp[0] \right\} \\ &= f \end{aligned}$$

**Simple result: intensity at every reciprocal lattice point**

# Structure Factor

## body-centered cubic

Two atom basis:  $r = (0,0,0)$  &  $r = \left(\frac{1}{2}, \frac{1}{2}, \frac{1}{2}\right)$

$$F = f \left\{ \exp[-2\pi i(0 \cdot h + 0 \cdot k + 0 \cdot l)] + \exp\left[-2\pi i\left(\frac{1}{2} \cdot h + \frac{1}{2} \cdot k + \frac{1}{2} \cdot l\right)\right] \right\}$$
$$= f \left\{ 1 + \exp[-\pi i(h + k + l)] \right\}$$

$h, k$  &  $l$  are integers, so  $h + k + l = N$  (where  $N$  is an integer)

The exponential can then take one of two values:

$$\exp[-\pi i(h + k + l)] = +1 \quad \text{if } N = \text{even}$$

$$\exp[-\pi i(h + k + l)] = -1 \quad \text{if } N = \text{odd}$$

So:

$$F = 2f \quad \text{if } N = \text{even}$$

$$F = 0 \quad \text{if } N = \text{odd}$$

# Structure Factor

## body-centered cubic

### Allowed low order reflections are:

- 110, 200, 220, 310, 222, 321, 400, 330, 411, 420 ...

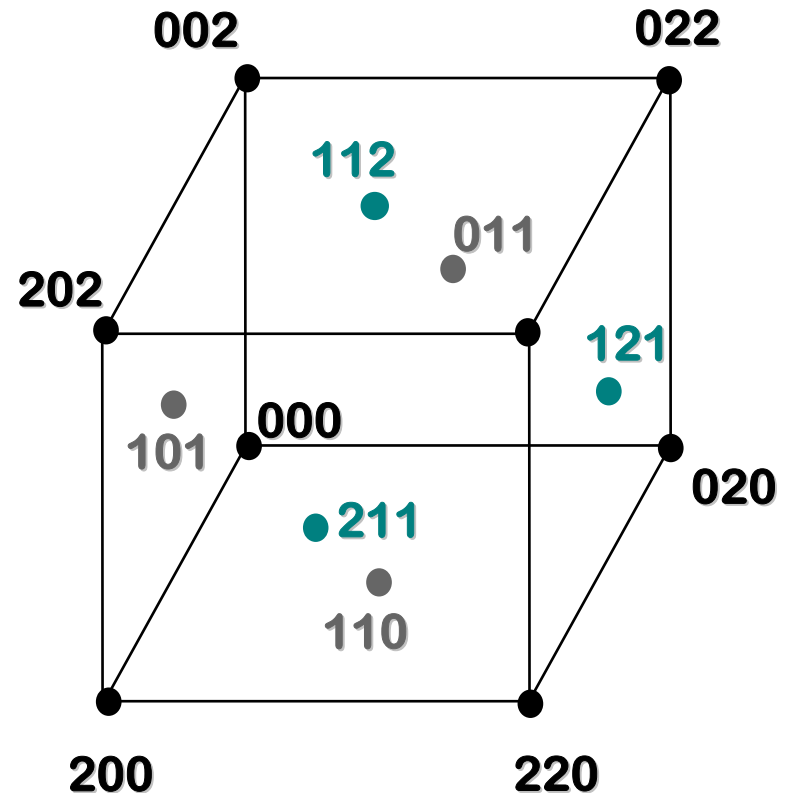

### Forbidden reflections are:

- 100, 111, 210

### Origin of forbidden reflections?

- Identical plane of atoms halfway between causes destructive interference

Real bcc lattice has an fcc reciprocal lattice

# Structure Factor

## face centered cubic

---

Four atom basis:  $r = (0, 0, 0)$ ,  $r = \left(\frac{1}{2}, \frac{1}{2}, 0\right)$ ,  $r = \left(\frac{1}{2}, 0, \frac{1}{2}\right)$  &  $r = \left(0, \frac{1}{2}, \frac{1}{2}\right)$

$$F = f \left\{ 1 + \exp[-\pi i(h+k)] + \exp[-\pi i(k+l)] + \exp[-\pi i(h+l)] \right\}$$

So:

$F=4f$  if  $h, k, l$  all even or odd

$F=0$  if  $h, k, l$  are mixed even or odd

# Structure Factor

## face centered cubic

**Allowed low order reflections are:**

- 111, 200, 220, 311, 222, 400, 331, 310

**Forbidden reflections:**

- 100, 110, 210, 211

**Real fcc lattice has a bcc reciprocal lattice**

# Structure Factor

## NaCl (rock salt) structure

Na on each fcc site, but with a two atom basis :

$$r_{\text{Na}} = (0, 0, 0) \quad \& \quad r_{\text{Cl}} = \left( \frac{1}{2}, \frac{1}{2}, \frac{1}{2} \right)$$

$$F = \left\{ f_{\text{Na}} + f_{\text{Cl}} \exp[-\pi i(h+k+l)] \right\} \times \\ \left\{ 1 + \exp[-\pi i(h+k)] + \exp[-\pi i(k+l)] + \exp[-\pi i(h+l)] \right\}$$

$$F = 4(f_{\text{Na}} + f_{\text{Cl}}) \quad \text{if } h, k, l \text{ all even}$$

$$F = 4(f_{\text{Na}} - f_{\text{Cl}}) \quad \text{if } h, k, l \text{ all odd}$$

$$F = 0 \quad \text{if } h, k, l \text{ mixed}$$

If  $h, k, l$  all odd have 'chemically sensitive' reflections

# Structure Factor

## Ni<sub>3</sub>Al (L1<sub>2</sub>) structure

Simple cubic lattice, with at four atom basis

$$r_{\text{Al}} = (0, 0, 0), r_{\text{Ni}} = \left(\frac{1}{2}, \frac{1}{2}, 0\right), r_{\text{Ni}} = \left(\frac{1}{2}, 0, \frac{1}{2}\right) \text{ \& } r_{\text{Ni}} = \left(0, \frac{1}{2}, \frac{1}{2}\right)$$

$$F = f_{\text{Al}} + f_{\text{Ni}} \exp[-\pi i(h+k)] + \exp[-\pi i(k+l)] + \exp[-\pi i(h+l)]$$

So :

$$F = f_{\text{Al}} + 3f_{\text{Ni}} \quad \text{if } h, k, l \text{ all even or odd}$$

$$F = f_{\text{Al}} - f_{\text{Ni}} \quad \text{if } h, k, l \text{ are mixed even or odd}$$

Again, since simple cubic, intensity at all points.

But each point is 'chemically sensitive'.

# Chemically sensitive reflections

**Figure 16.5.** DF image from a chemically sensitive 110 reflection showing bright ordered domains in  $\text{Cu}_3\text{Au}$ . The dark areas in the bright domains are regions of local disorder induced by ion beam damage.

**Figure 16.6.** (A) DF image from a 002 superlattice reflection in GaAs. The  $\text{Al}_x\text{Ga}_{1-x}\text{As}$  is the lighter region because Al has replaced Ga in the GaAs (darker regions). (B) Diffraction pattern showing the less intense 002 and other superlattice reflections.

**Dark field images formed from chemically sensitive reflections produce a real space map of (highly) local chemistry**

# Long period superlattices

**Figure 16.8.** (A) Artificial GaAs/ $\text{Al}_x\text{Ga}_{1-x}\text{As}$  structure in which order is created by alternating four layers of GaAs and four of  $(\text{Al}_x\text{Ga}_{1-x})\text{As}$ . (B) DP showing three superlattice spots between the fundamental reflections in the 020 direction.

**Figure 16.9.** (A) Artificial superlattice of Si and Mo layers  $\sim 5$  nm thick (B) Expanded DP around 000 showing many superlattice spots (arrowed). The large spacing of the superlattice in real space results in very small spacing of the superlattice reflections in the DP in reciprocal space. Compare with Figure 16.8.
